Autonomous Flying Robots Kenzo Nonami

2014-11-16 The advance in robotics has boosted the application of autonomous vehicles to perform tedious and risky tasks or to be cost-effective substitutes for their - man counterparts. Based on their working environment, a rough classification of the autonomous vehicles would include unmanned aerial vehicles (UAVs), -

manned ground vehicles (UGVs), autonomous underwater vehicles (AUVs), and autonomous surface vehicles (ASVs). UAVs, UGVs, AUVs, and ASVs are called UVs (unmanned vehicles) nowadays. In recent decades, the development of - manned autonomous vehicles have been of great interest, and different kinds of autonomous vehicles have been studied and developed all over the world. In particular, UAVs have many applications in emergency situations; humans often cannot come close to a dangerous natural disaster such as an earthquake, a flood, an active volcano, or a nuclear disaster. Since the development of the first UAVs, research efforts have been focused on military applications. Recently, however, demand has arisen for UAVs such as aero-robots and flying robots that can be used in emergency situations and in industrial applications. Among the wide variety of UAVs that have been developed, small-scale HUAVs (helicopter-based UAVs) have the ability to take off and land vertically as well as the ability to

cruise in ight, but their most important capability is hovering. Hovering at a point enables us to make more effective observations of a target. Furthermore, small-scale HUAVs offer the advantages of low cost and easy operation.

Geospatial Technology for Earth Observation
Deren Li 2009-09-18 Earth Observation interacts
with space, remote sensing, communication, and
information technologies, and plays an
increasingly significant role in Earth related
scientific studies, resource management,
homeland security, topographic mapping, and
development of a healthy, sustainable
environment and community. Geospatial
Technology for Earth Observation provides an in-
depth and broad collection of recent progress in
Earth observation. Contributed by leading
experts in this field, the book covers satellite,
airborne and ground remote sensing systems and
system integration, sensor orientation, remote
sensing physics, image classification and
analysis, information extraction, geospatial

service, and various application topics, including cadastral mapping, land use change evaluation, water environment monitoring, flood mapping, and decision making support. Geospatial Technology for Earth Observation serves as a valuable training source for researchers, developers, and practitioners in geospatial science and technology industry. It is also suitable as a reference book for upper level college students and graduate students in geospatial technology, geosciences, resource management, and informatics.
